Compact high performance heat storage

High efficient use of waste heat from industry and power plants
from 150° to 850°C

Heimo WALTER and Andreas WERNER

Thermal energy storage

Which possibilities are available?

Solid-solid: heat energy will be stored at the transformation from one crystal structure to another.

Sensible energy storage

2 developed technologies

- “SandTES” heat exchanger technology
- “Fluidization based particle -TES” heat exchanger technology

SandTES – heat exchanger technology

SandTES – heat exchanger technology

- **Storage of high temperature thermal energy with natural occurring material powder**
 - low investment cost,
 - material sufficient available,
 - harmless handling possible,
 - operation under ambient pressure
 - good scalability

SandTES – heat exchanger technology

➤ Storage of high temperature thermal energy with powder [50-100 µm]

- Sand, corundum, ash, bauxite, magnesium oxide, ...

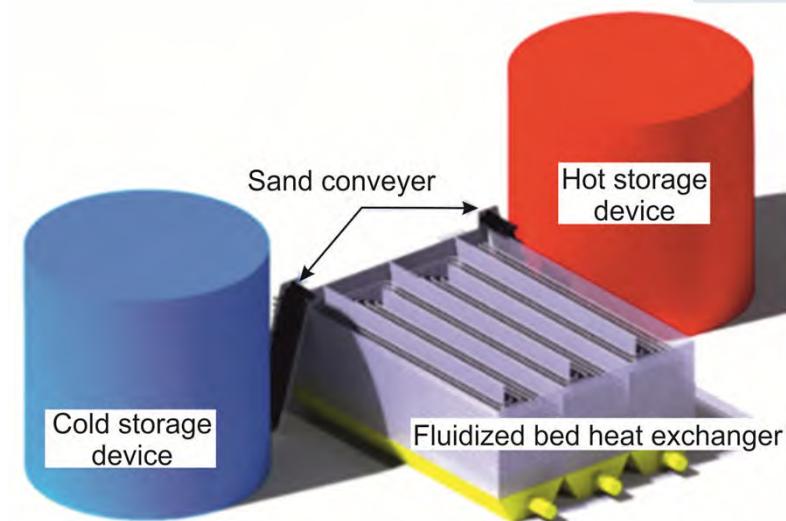

➤ Aktive storage technology

- Primary heat transfer medium & storage medium will be transported
- Stationary operation, high thermal efficiency

➤ SandTES – fluidized bed heat exchanger

- Tube bundle in a stationary fluidized bed
- Counter current heat exchanger design
- Natural- or once through power plants,
industrial processes

➤ Decoupling of storage capacity from heat capacity

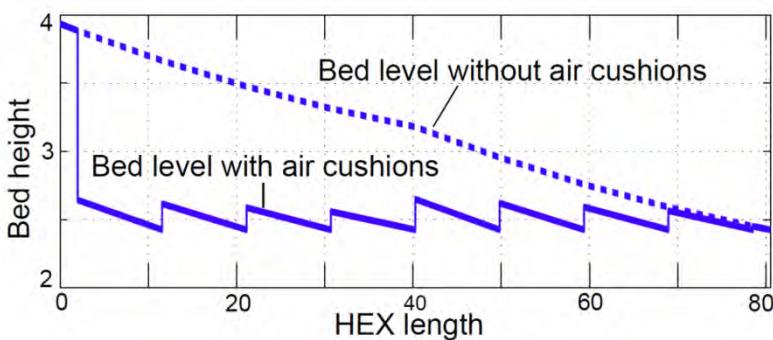

SandTES – heat exchanger technology

sandTES air-cushion principle

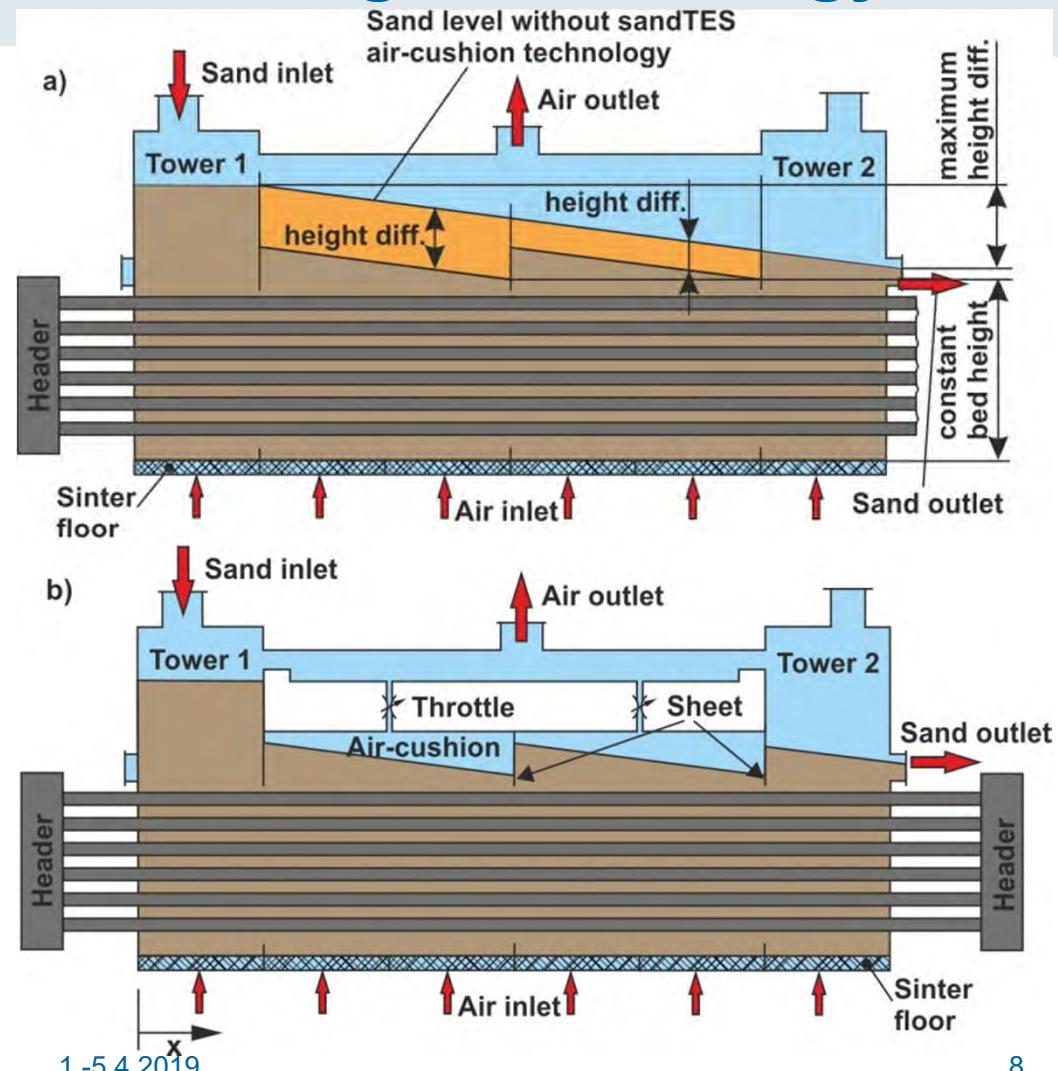

horizontal pressure gradient of viscous sand suspension:

$$\frac{\partial p_{fb}}{\partial x} = \underbrace{(1 - \varepsilon)}_{\text{porosity}} \underbrace{(\rho_p - \rho_f)g}_{\text{buoyancy force}} \frac{\partial h(x)}{\partial x}$$

Compound pressure drop Δp_{HEX} has to be equal at every cross section along the particle's flow direction

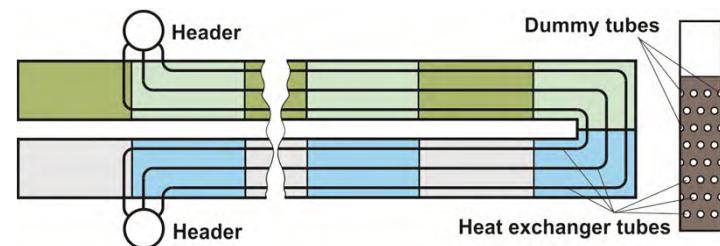

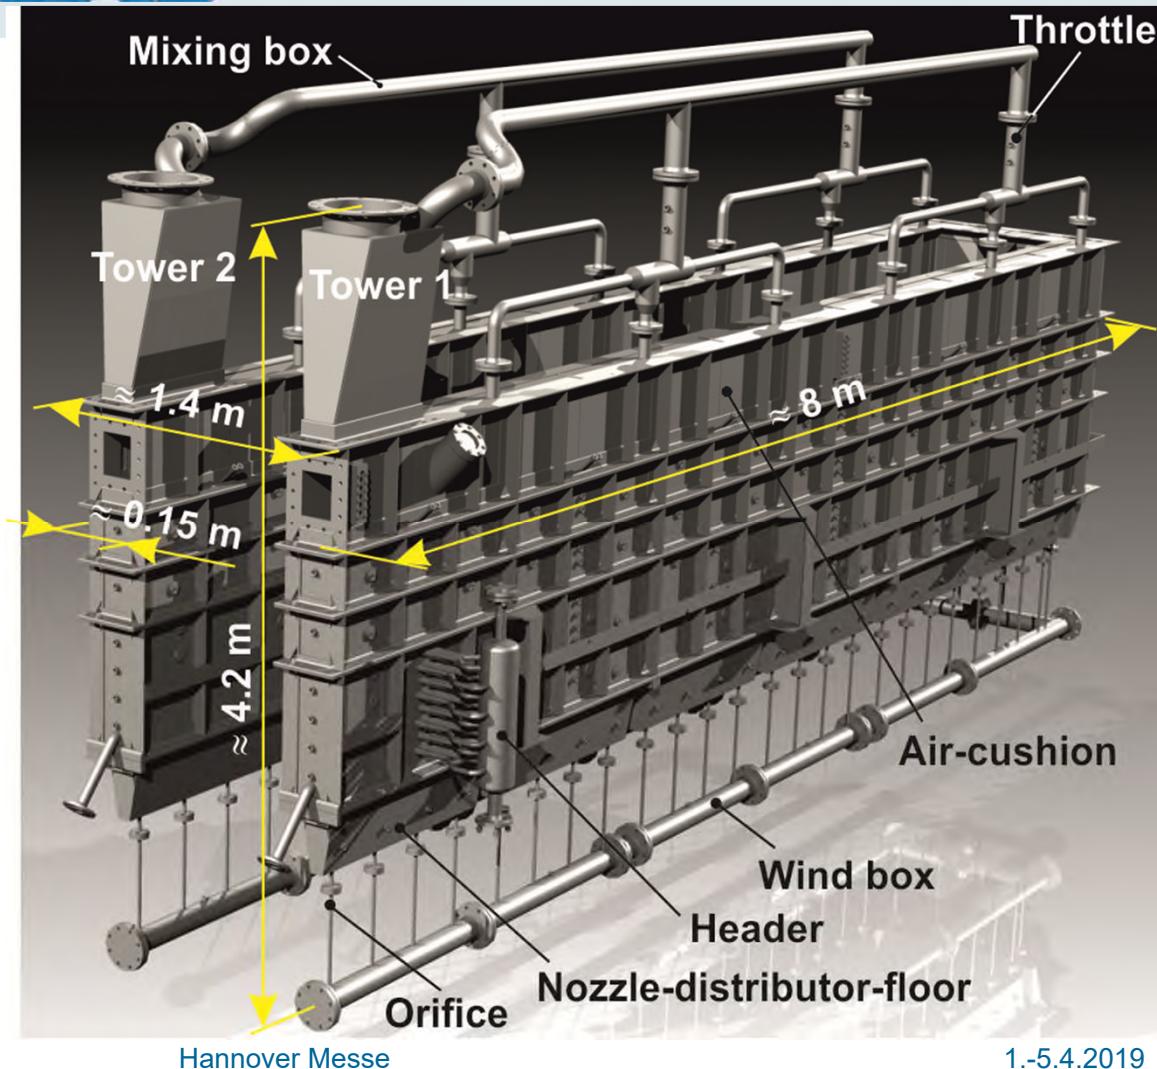

Hannover Messe

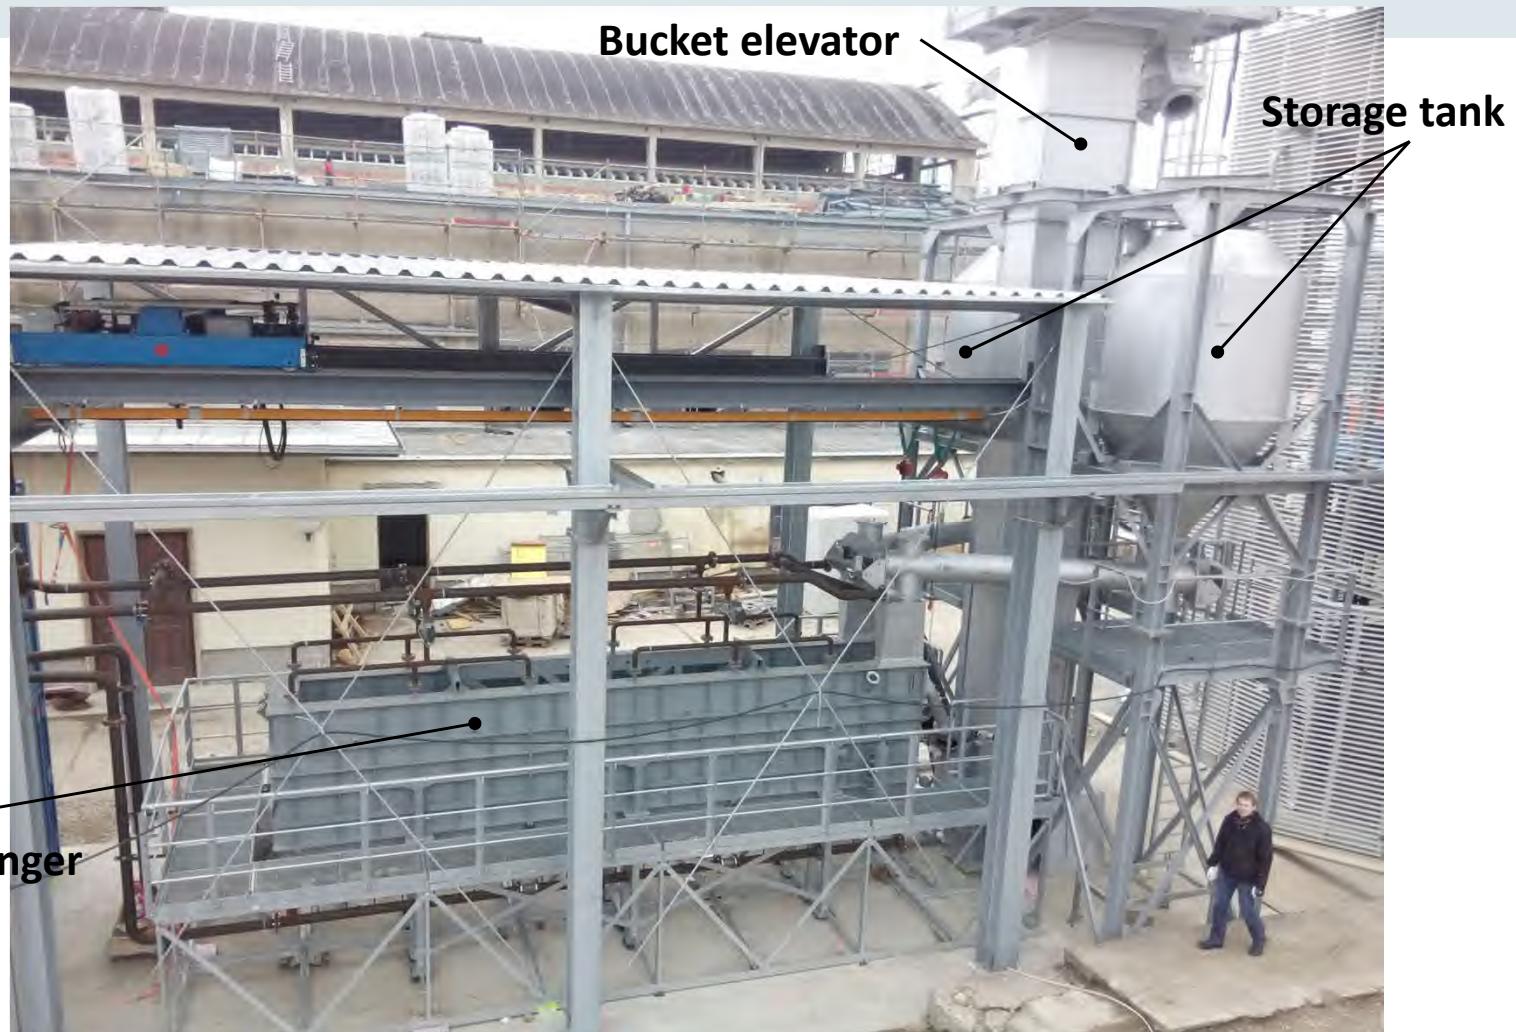

1.-5.4.2019

8

SandTES – test rig

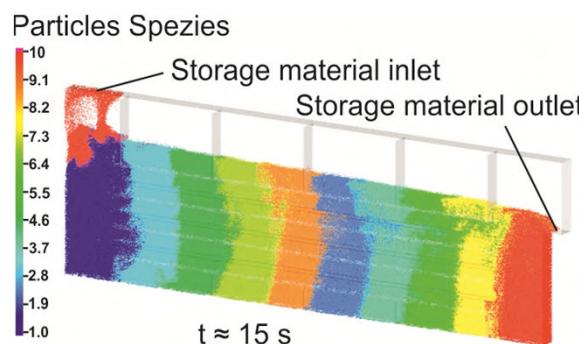

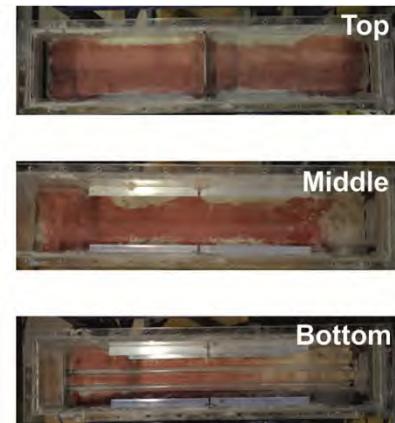

SandTES – test rig

SandTES – heat exchanger technology

Experimental and numerical investigation

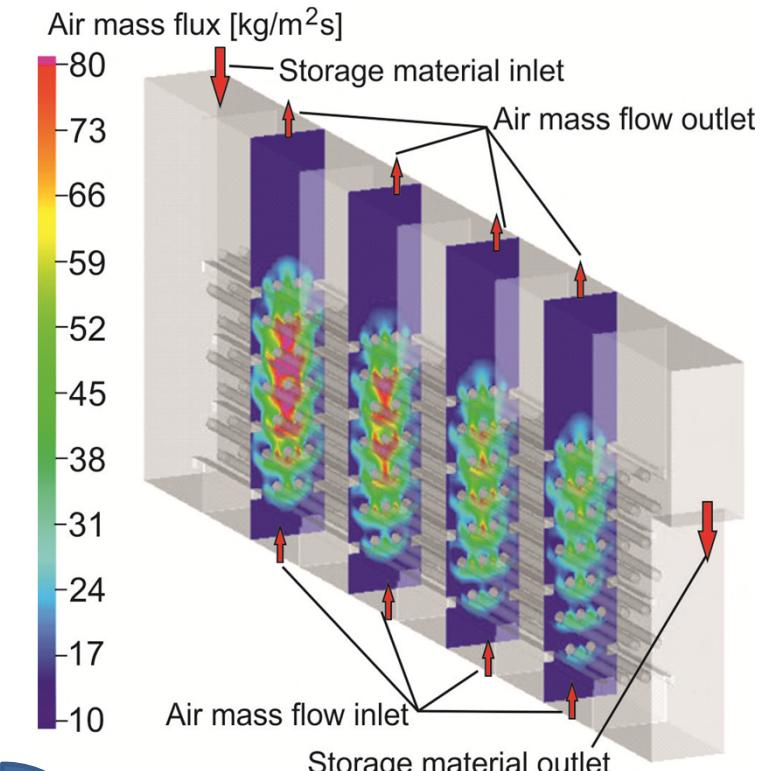

Mixing behavior, verification of the concept:

Hannover Messe

1.-5.4.2019

Flow behavior of the storage material within the tube bundle:

11

Fluidisation based particle – TES Technologie

Hannover Messe

1.-5.4.2019

12

Fluidisation based particle – TES technology

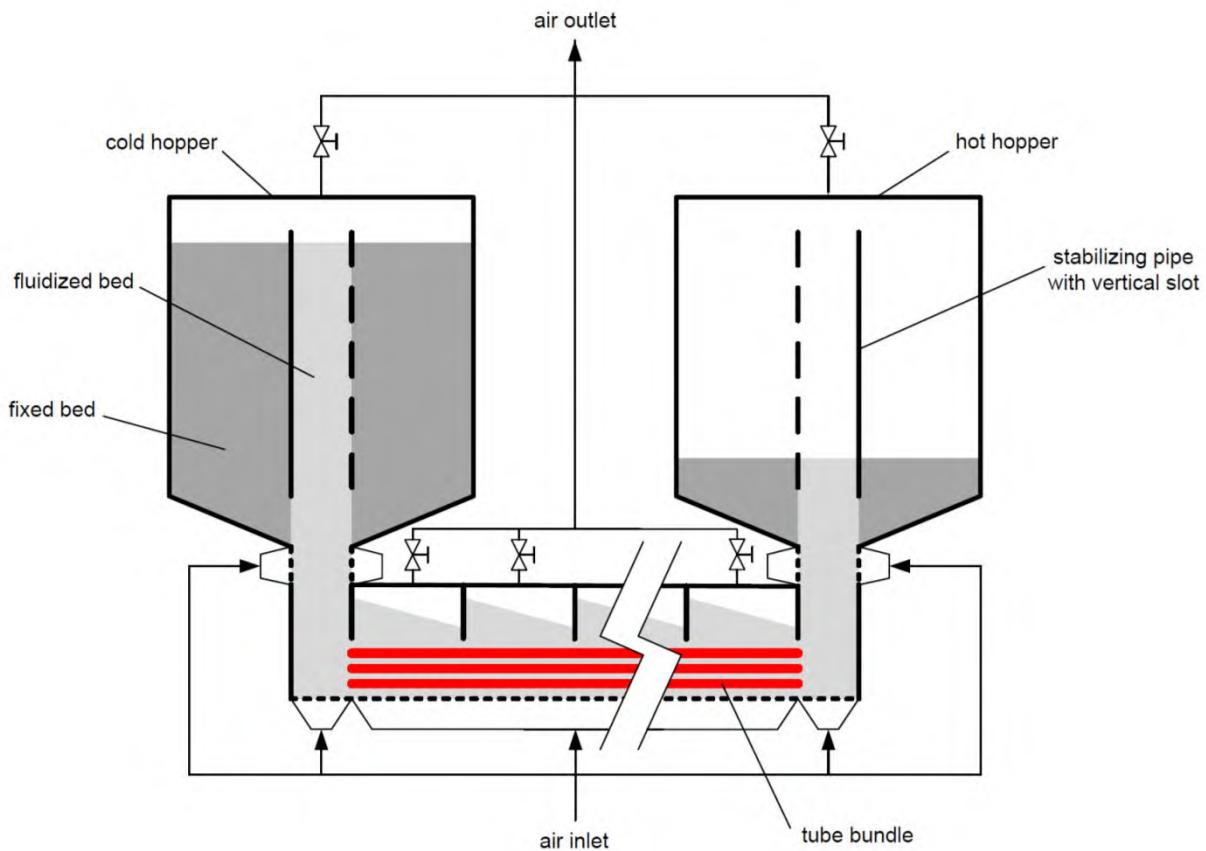

Further development of the SandTES-technology for short or middle storage times and –capacities.

**Appropriate for Particle diameter of 70 – 100 µm
Operation temperature up to approx. 800°C**

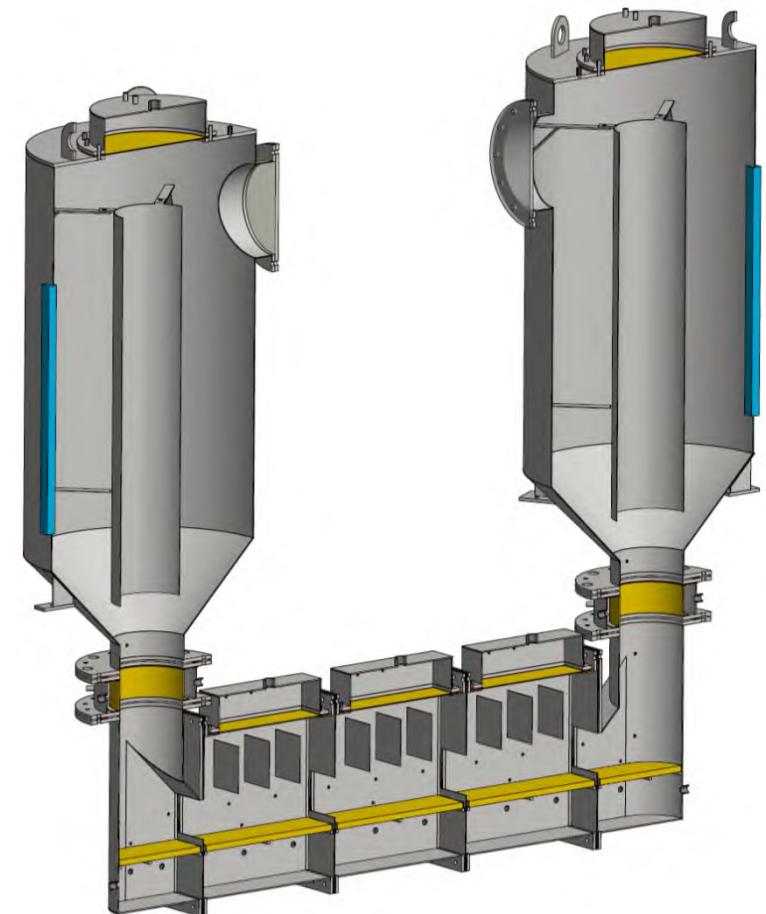

technology concept without rotating components, like

- **bucket elevator**
- **screws**

FP – TES: test rig

Channel cross section of 250 mm x 190 mm
Hoppers: 800 kg silica sand

Experimental and numerical investigations

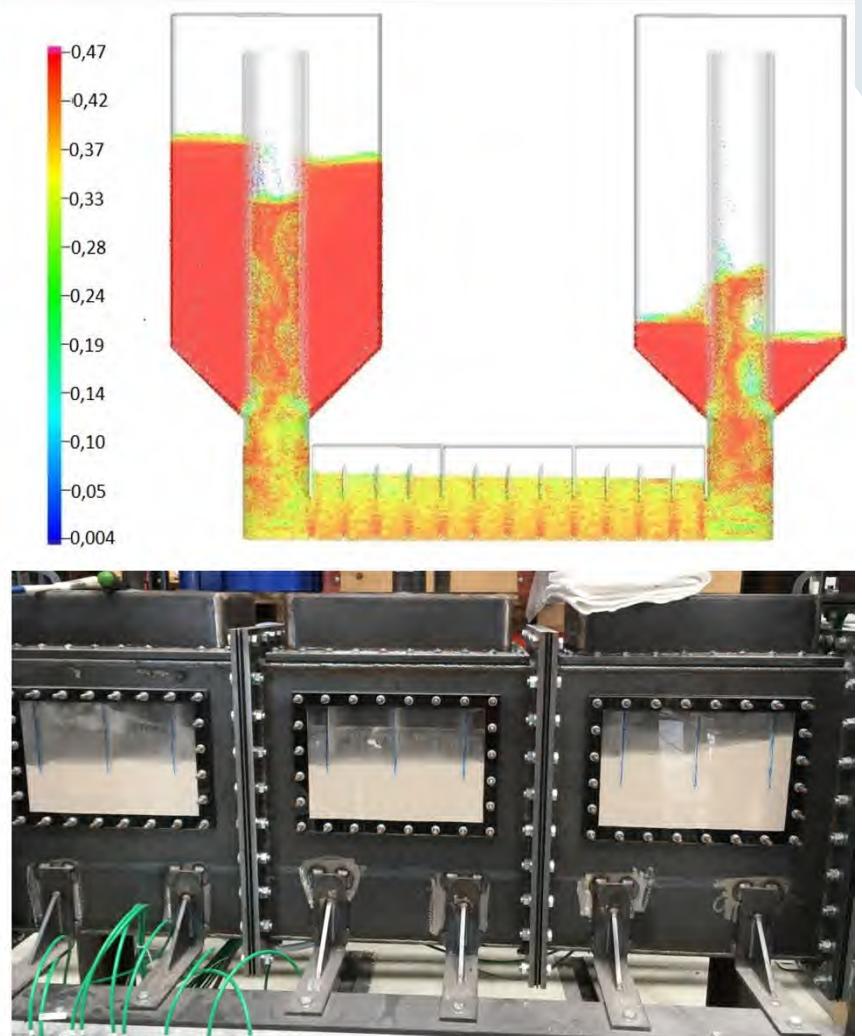

Hannover Messe

FP – TES: test rig

1.-5.4.2019

15

FP – TES: maximum dimensions

The maximum design of the FP-TES depends on the hopper design.

Height of the cylinder: 3m (height of the storage material; without freeboard)

Slope of the cone approx. 15°

Total height of the hopper: 3,5m

Total fluidized height over the sinter floor approx. 4 to 4,5 m

Diameter of the cylinder: 4 m

For a temperature difference of approx. $\Delta T = 500^\circ\text{C}$ following capacities are possible:

Silica sand ($c_p = 900 \text{ J/kgK}$): capacity: 6,2 MWh

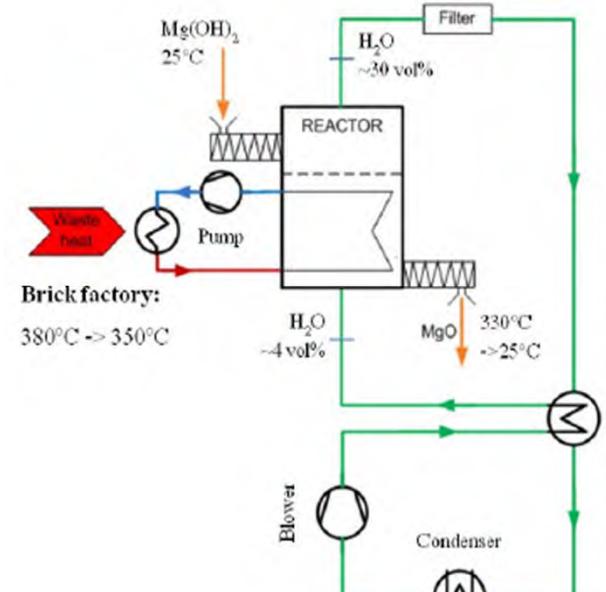

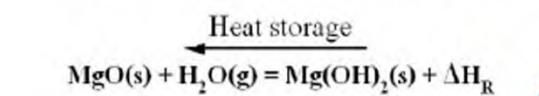

Corundum ($\rho_{\text{Schütt}} = 1458 \text{ kg/m}^3$; $c_p = 1100 \text{ J/kgK}$): capacity: 8,9 MWh

Thermochemical energy storage

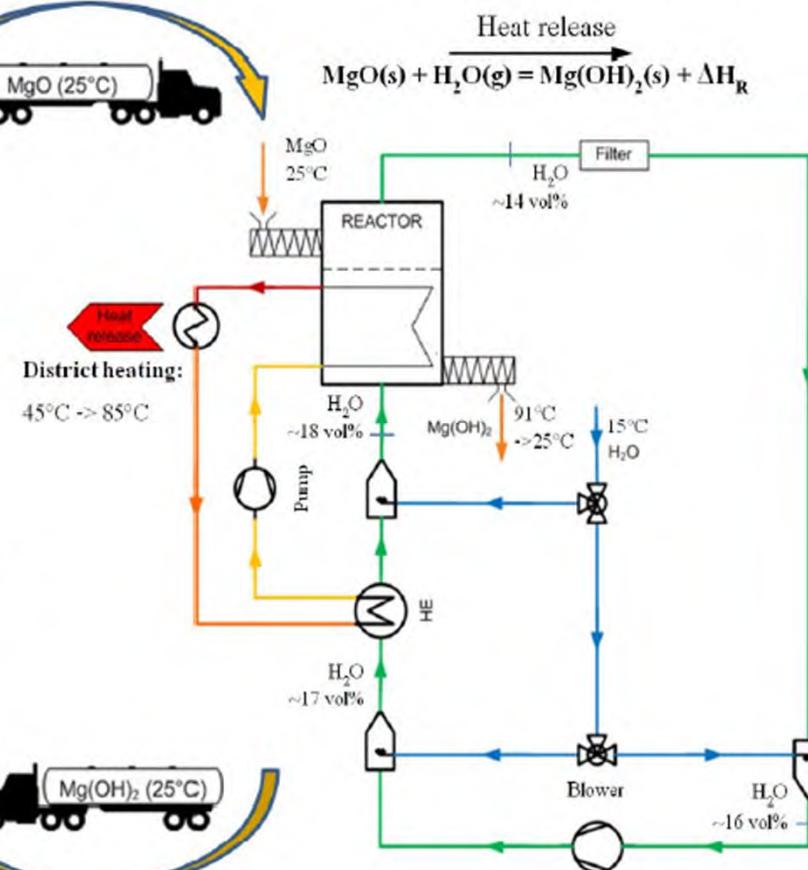

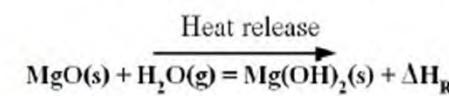

Thermochemical energy storage

What's this?

Heat load (Dehydration):

Heat output (Hydration):

Algorithmic database search

- Search to potential reactions in HSC
- ✓ restricted to solid/gas - reaction
- ✓ gas: H_2O , CO , O_2 , SO_2 , NH_3
- ✓ ~ 3000 reactions detected

SolidHeat Kinetics

From SolidHeat Basic → SolidHeat Kinetics, to investigate the reaction kinetics of storage material combinations of interest:

Compact heat storage transition metal ammoniac compounds

Problem: operation temperature of catalysts after a cold start will be reached slowly

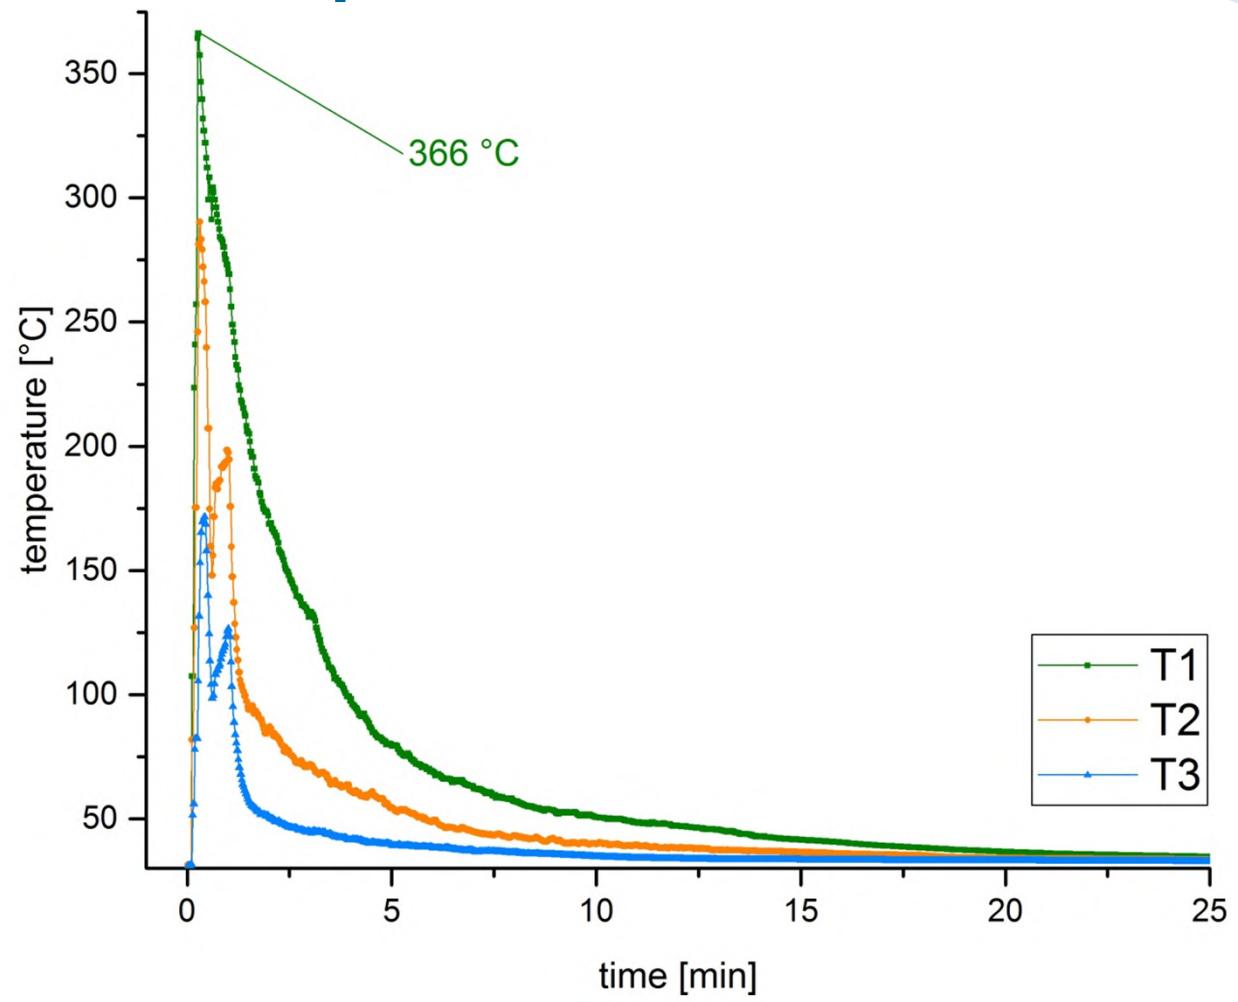

Solution: fast preheating of the catalysts: with the help of transition metal ammoniakate

Austrian Patent, 2016, Verfahren zur thermochemischen Energiespeicherung

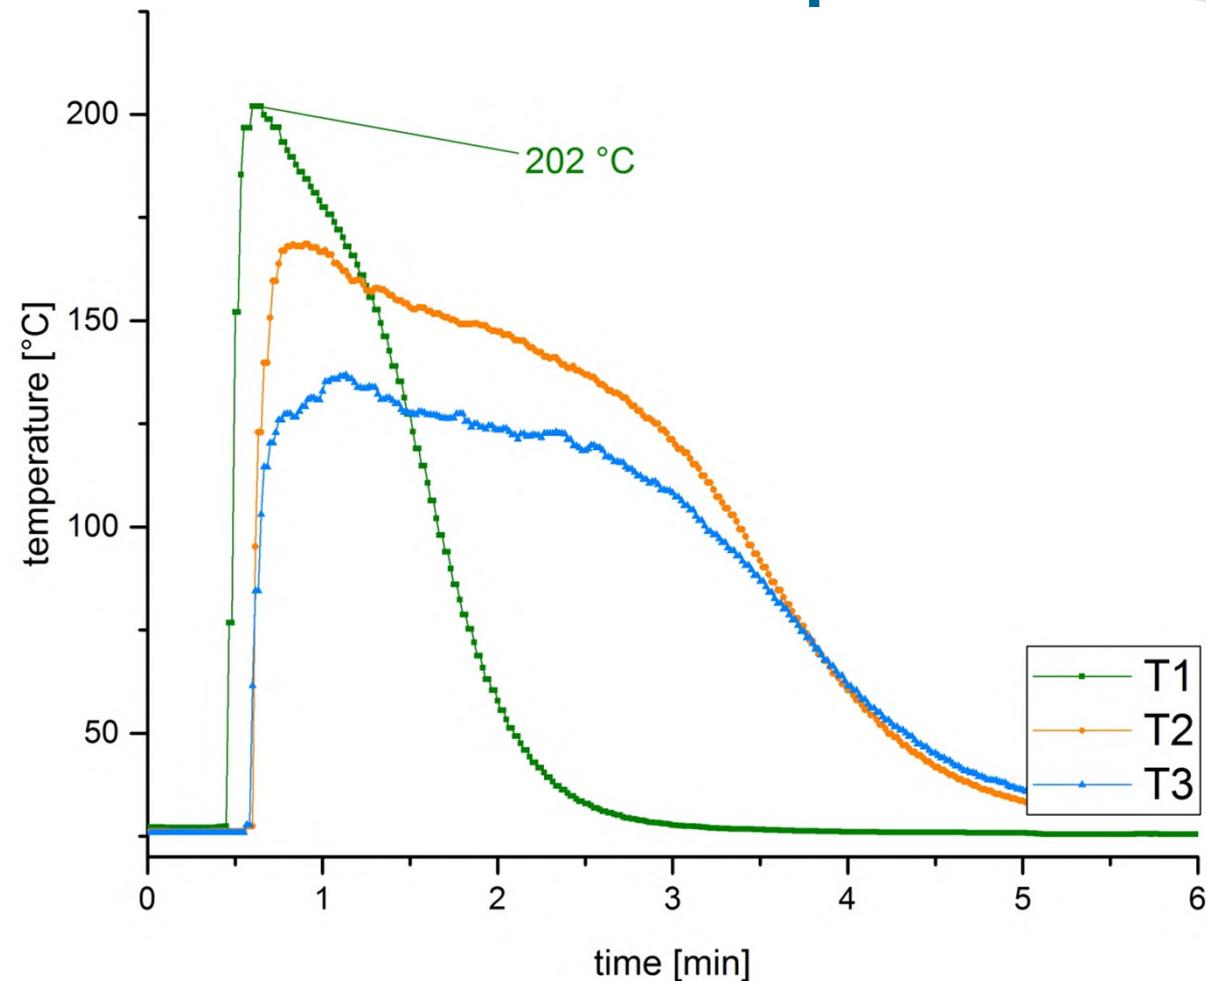

SolidHeat Kinetics: transition metal ammoniac compounds

**CuCl₂, NH₃ undiluted
as reactive gas**

Compact heat storage transition metal ammoniac compounds

**CuSO₄ on Zeolith, NH₃ undiluted
as reactive gas**

Aims, chance, problems of TC-TES

- **Aims:** supply of energy storage materials with high storage density and power and related systems
- **Chance:** based on the basic research knowledge is given also for other scientific areas: reaction technology, improvement of measurement methods
- **Problems & risks:** TRL-level so, that an intensive industrial research can start with experimental reactors in semi-industrial size – therefore interested industrial partners with relevant financial resources are looked for!
